

Graphs are everywhere. From websites adding social capabilities, to companies needing fast online recommendation engines, to the connected data sets one finds in telecommunications, finance, bioinformatics and beyond, organizations are adopting the Neo4j database both for its runtime speed, and for the ease of development it presents when working with connected data. Neo Technology pioneered the graph database in 2000, and have been instrumental in bringing the power of the graph to numerous organizations worldwide, including **25 Global 2000 customers, such as Cisco, HP, Accenture, Deutsche Telekom, and Telenor.** Serving customers in production for over a decade, **Neo4j is the world's leading graph database** with the largest ecosystem of partners and tens of thousands of successful deployments.

Look for the Neo team throughout the event and at our multiple sessions listed in the NoSQL Now! program. Also, join the Neo Technology team this fall at our GraphConnect San Francisco, the only conference bringing together the rapidly growing community and ecosystem around graph databases. Held in downtown San Francisco from October 3-4, 2013, the event is set to bring together graph thought leaders, researchers and developers from around the globe. For more information about this event and on our other GraphConnects, visit: www.graphconnect.com/
